How to Make a Location QR Code

1

Choose address or coordinates

Pick 'Address or place name' for a normal street address or landmark, or 'Coordinates' for an exact pin with no address — a trailhead, festival gate, or parking lot.

2

Enter the location

Type the address, or paste the latitude and longitude. To get coordinates, right-click the spot in Google Maps (long-press on mobile) and copy them — latitude first, then longitude.

3

Download the QR code

Download as PNG, JPG, or SVG. SVG stays sharp on signs and brochures at any print size.

4

Scan-test it on both phones

Modern iPhone and Android cameras read the code and offer to open it in Apple Maps or Google Maps — no separate app needed. Scan-test on both before printing.

Make your own QR code → ezqr.ca/location-qr-code
