# How to Make a Picture QR Code

**1**

## Upload your picture

Upload a logo, photo, or product shot. Everything runs in your browser — your image is never uploaded to a server.

**2**

## Add your link

Paste the URL the code should open. Simple, high-contrast images with a clear subject work best.

**3**

## Pick a style

Halftone rebuilds the picture out of QR dots; photo overlay keeps it smooth. Use the balance slider to trade off between an almost-invisible code and a bolder one that scans from further away, and toggle color and rounded dots to taste.

**4**

## Download and test

Download the high-resolution PNG. The built-in test-scan warns you if the image is too busy — scan-test on an iPhone and an Android before printing at 2 cm or larger.
