# How to Make a QR Code Menu for Your Restaurant

**1**

## Host your menu at a public link

A menu page on your website, a Google Doc set to "Anyone with the link," or a hosted PDF — anything a phone browser can open.

**2**

## Create a dynamic QR code in EZQR

A dynamic code lets you change the destination when prices, hours, or seasonal specials change — the printed table tent stays exactly as it is.

**3**

## Print it on table tents, the door, and receipts

Around 3–5cm with a clear caption like "Scan for our menu." Keep a clear margin around the code so cameras can lock on quickly.

**4**

## Test the scan on iPhone and Android

Scan from where guests actually sit, on both phones, before putting table tents out.

**5**

## Update the menu whenever it changes

When dishes or prices change, update the destination from your dashboard — the same printed codes now show the new menu, with no reprinting.

**Make your own QR code → [ezqr.ca/qr-codes-for-restaurants](https://ezqr.ca/qr-codes-for-restaurants)**
