# How to Make a WiFi QR Code

**1**

## Type your network name (SSID)

Enter it exactly as it appears when you connect — SSIDs are case-sensitive, so match the capitalisation and spacing.

**2**

## Enter the WiFi password

Type the password for the network. Everything is generated right in your browser — your SSID and password are never uploaded to us.

**3**

## Pick the encryption type

WPA covers WPA, WPA2, and WPA3 and is right for almost every modern router. Choose WEP only for very old equipment, or None for an open network.

**4**

## Download the QR code

Download as PNG, JPG, or SVG. Use SVG for print so the code stays crisp at any size — on a table tent, a guest-room card, or a fridge magnet.

**5**

## Test it, then place it where guests connect

Scan with both an iPhone and an Android to confirm the join prompt appears. For public spots, point it at a guest network rather than your main WiFi.
